Create a Hypothesis The definition of a hypothesis is: "an explanation of a problem, a theory, or something in nature based on a set of observations"

List the two causes and effects of a disease A hypothesis must always have

two causes and two effects The Causes and Effects of a disease are listed below. A) Diesis - Causes Chronic inflammation - In cancerous tissue, cancer cells live off the bloodstream and need oxygen to grow. But since there is not enough oxygen, cancer cells start living off the bloodstream. If this continues for a prolonged time, the white blood cells in the blood stream will attack the cancer cells. White blood cells will attack white blood cells and the white blood cells will attack the cancer cells Prolonged inflammation = Cancer B) Diesis - Effects Inflammation - Cancer cells

produce signals to attract white blood cells. They create a mound of tissue around them. The more advanced the stage of the cancer, the more intense the inflammation. Cancerous tissue creates signals to attract white blood cells. White blood cells will attack white blood cells and cancer cells.

Inflammation = Wasting D)

Conclusion: Inflammation is the cause of cancer and wasting. Cause-Effect Diagram of Processes - Hypotheses. Below is the diagram of the causes and effects of a disease. A) Causes: Dysis, Prolonged inflammation, Wasting. B) Effects: Inflammation, Wasting. C)

Conclusion Inflammation = Disease
Wasting = Disease What does the diagram below illustrate? The body wastes as a result of an increased amount of inflammation. In this particular disease, the increased amount of inflammation was caused by the disease. Diagram of Causes and Effects - Hypotheses and Real Example Disease Inflammation
Inflammation causes a disease. The blue box at the top represents the problem and the yellow boxes below represent causes. Consequences - Hypotheses The disease can be prevented by - A) Raising the body's
